Project Halcyon - Annual Report

Project Halcyon is a fictional desalination programme run by the Ostrava Water Cooperative. This report summarises the pilot phase, the plant’s output, the budget for phase two and the project team. The cooperative was founded in 2011 and serves eleven coastal villages.

2. Pilot plant output

The pilot plant at Kessel Bay produces 1,840 cubic metres of fresh water per day. Output dropped to 1,120 cubic metres per day during the February storms, when intake filters had to be cleaned hourly. Energy use averaged 3.1 kilowatt-hours per cubic metre.

3. Budget

The total budget for phase two is 4.2 million euros, approved by the cooperative board on 14 March 2025. Of this, 2.6 million euros funds a second membrane train and 0.9 million euros funds a solar array. The remaining amount is held as a contingency reserve.

4. Project team

The lead engineer is Mirela Vantongeren. Membranes are supplied by Quillfeather Membranes, a company based in Tallinn. Water quality testing is done by the Brannock Laboratory every Tuesday. Questions about the project go to the cooperative’s secretary.
